

Nominee: Correlata Solutions

Nomination title: Correlata Data-Center Migration

Correlata Data Center Migration:

The insurance company's data center relocation project was a real challenge due to the extremely aggressive project timeline and the need for minimal down time due to the availability requirements and service level agreements (SLAs). They were seeking a knowledgeable and capable provider to move all of their data center IT Infrastructure, to provide technical expertise to ensure that the systems and applications were quickly up and running and functional following the migration project, and to meet the two business days' critical deadline.

The Migration Planning and Execution

Correlata service provider determined that due to the size, complexity and short timeframe needed for the relocation, the migration would occur in one large seamless move event, which is why

Correlata Solution was chosen. The technical migration team had pre-established timelines and goals which were then adopted to create a standardized migration process. With Correlata the client and the service

provider could identify IT infrastructure elements and services allocated to each system, application and

environment, identify orphan, leftovers and miss-configurations exposing allocated but not in use IT resources, so the IT department was able to do the migration to their new location in just two days.

Business Outcomes

The client's data center project presented a very complex move of a large infrastructure with an extremely aggressive timeline.

Due to the Correlata solution support, the client was able to meet his critical business needs immediately following the migration due to the full functioning environment.

The relocation project provided the customer with a world class data center at their new location that

offers reliability, scalability, and availability.

Correlata for Efficient Data Center (DC)

Prior to any migration DC to DC or to Cloud Services, implementing pay-what-you-consume strategy, it is essential for organizations to identify the true usage of IT services. There is a need to consolidate all IT related

resources provisioned to each one of the cost centers in order to measure and quantify the allocated and used resources.

Business actions are taken by executive decision makers based on their understanding of the topic in context, how it contributes to reducing costs and generating business growth; or in simple words – to maximize profit.

Correlata identifies IT infrastructure elements and services allocated to each LOB, application and environment, identifies orphan, leftovers and miss-configurations exposing allocated, but not in use, IT

resources and combines this information with the customer's own costs to reflect the real IT

infrastructure burdening, so the IT requirements to new cloud services will encompass the real need rather than preserve inefficiency.

Why nominee should win

because of the unique Business Outcomes as Follow:

- The client's data center project presented a very complex move of a large infrastructure with an extremely aggressive timeline.
- Due to the Correlata solution support, the client was able to meet his critical business needs
- immediately following the migration due to the full functioning environment.
- The relocation project provided the customer with a world class data center at their new location that offers reliability, scalability, and availability.
